

# Designing 3D-Printable Generative Art by 3D Turtle Graphics and Assembly-and- Deformation

Yasusi Kanada  
Dasyn.com, Japan

# Conventional 3D Printing

## ► FDM-type 3D printers

- There are many types of 3D printers, but a popular cheap one is called fused deposition modeling (FDM) type.
- They extrude melted plastic from the nozzle and solidify it.
- These printers accept “G-code” (drawing data and program)

# Two Types of 3D Design Methods for 3D Printing

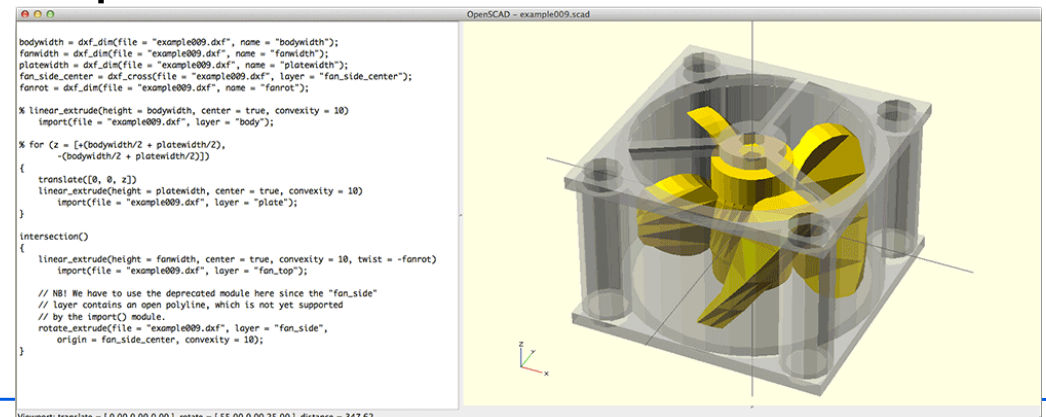

## ► Manual design method — conventional method

- 3D CAD/graphics tools and pointing devices are available.
- Examples: Autodesk CAD tools

## ► Generative design method — proposed method

- Models are algorithmically designed by using design tools
- Examples: Processing (P3D), OpenSCAD

# Proposal: Two Methods for Generative 3D Printing

## ▶ 1. Turtle-graphics-based Method

## ▶ 2. Assembly-and-deformation Method

# 1. Turtle-graphics-based Method

# Turtle Graphics

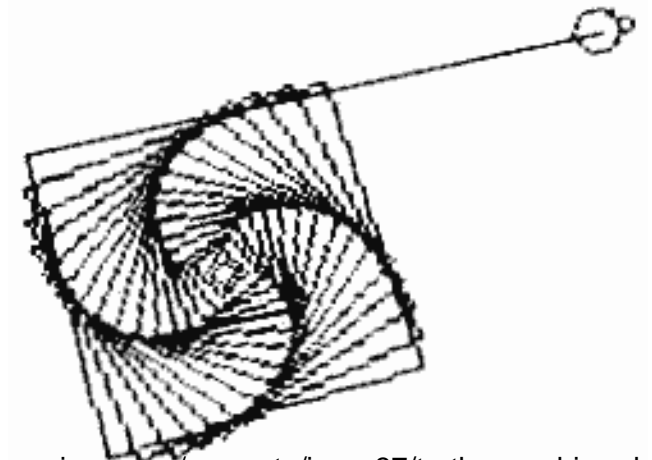

## ► Seymour Papert and Logo

- Papert designed Logo programming language for children.
- By using Logo, 2D line art can be drawn by a “turtle” — (2D) turtle graphics

## ► Drawing commands for turtle graphics

- forward  $d$ : move forward by  $d$ .
- left  $\theta$ : turn left by  $\theta$  (degrees).
- right  $\theta$ : turn right by  $\theta$  (degrees).

# 3D Turtle Graphics

- ▶ **Drawing commands**
  - forward  $d$ , left  $\theta$ , right  $\theta$
  - up  $\theta$ , down  $\theta$
- ▶ **Extended 3D turtle graphics**
  - Bernd Paysan, “Dragon Graphics”

Paysan, B., ““Dragon Graphics” Forth, OpenGL and 3D-Turtle-Graphics”, 2009, <http://bigforth.sourceforge.net/dragongraphics-eng.pdf>

# “Turtle Graphics” by 3D Printing

---

- ▶ **Drawing commands are translated into G-code.**
  - Forward → G1 (moving while printing)
- ▶ **Turtle coordinates are converted to Descartes coordinates — used in G-code**
- ▶ **Selection of a turtle coordinate system**
  - Polar coordinates
    - Coordinates for flight simulators
      - easy to get lost for the direction of gravity
  - Cylindrical coordinates — selected

# Alternatives and API

## ► Alternatives

- Language similar to Logo
- API (library) for conventional languages

## ► API for Python, `turtle.py`, was developed and published.

- Cylindrical coordinates are used:  
forward( $r$ ,  $z$ ) instead of up/down  $\theta$  and forward  $d$ .
- Example: helix

```
turtle.init(FilamentDiameter, HeadTemperature, BedTemperature,
            DefaultVelocity)
t = turtle.Trace(CrossSection,
                x0, y0, z0)

dz = 0.4 / 72
for j in range(0, 16):
    for i in range(0, 72):
        t.forward(1, dz)
        t.left(5)
t.draw()
```

- `turtle.py` is publicly available.

# Development Method

► Following steps are repeated until succeeded.

## ■ Program description

```
temp.py
#!/usr/bin/python
# -*- coding: utf-8 -*-

import turtle;
from turtle import forward, left, right, up, down, speed, comment, debug;

## Printer parameter ##
IsRostock = True;
# IsRostock = False; # Printerbot
-U:*** temp.py Top L9 (Python)-----
File "turtleTest.py", line 215, in genTree2
  genTree2_1(-30, 0, 0.4, 0, 30, thickCrossSection);
NameError: global name 'thickCrossSection' is not defined
bash-3.2$ python turtleTest.py >fractal.gcode
bash-3.2$ python turtleTest.py >fractal.gcode
bash-3.2$ python turtleTest.py >tree1.gcode
bash-3.2$
--:*** *shell* Bot L32 (Shell:run)-----
```

I use Python and Emacs.

## ■ Confirmation by graphics

I use a tool called Repetier Host

## ■ 3D printing

I use Rostock MAX 3D printer.

# Printing Process of Skewed Pyramid

[youtu.be/7H5-acxQ\\_RE](https://youtu.be/7H5-acxQ_RE)

# Production (Printing Results)

## ▶ 2D fractal figure

## ▶ Other 2D figure

# Production (Printing Results) (cont'd)

## ► Rotation and enlarging/reducing

### ■ Shrinking patterns

### ■ Expanding pattern

# Production (Printing Results) (cont'd)

## ► A sparse pattern

■ Designed shape

■ Printed shape

■ Some filament dropping is unavoidable.

# Problem of Turtle-graphics-based Method

---

- ▶ **It is not easy to design printable objects.**
  - Printed filament must be supported.
  
- ▶ **An easier design method is required.**

## **2. Assembly-and-deformation Method**

# Outline of the Method

## ► Objects are designed by two steps.

## ► Python API “draw3dp.py” is being developed.

- Publicly available.
- No GUI is available yet.

# Helical/spiral Printing Method

- ▶ This method is used in the API (`draw3dp.py`).
- ▶ This method prints objects helically or spirally (instead of printing layer-by-layer).

Spiral printing

Helical printing

# Deformation

- ▶ It is not easy to generate complex shapes only by parts combination.
- ▶ “Deformation” generates various shapes and directions in a generative way while preserving printability.
- ▶ Original shape and Deformed shapes

# Description of Deformations\*

---

## ► Deformation using Descartes coordinates

**`deform_xyz(fd(x, y, z), fc(c, x, y, z), fv(v, x, y, z))`**

- *fd* : mapping location (*x*, *y*, *z*) to (*x'*, *y'*, *z'*).
- *fc* : mapping cross section *c* at (*x*, *y*, *z*) to *c'* at (*x'*, *y'*, *z'*).
- *fv* : mapping printing speed *v* at (*x*, *y*, *z*) to *v'* at (*x'*, *y'*, *z'*).

## ► Deformation using cylinder coordinates

**`deform_cylinder(fd(r, θ, z), fc(c, r, θ, z), fv(v, r, θ, z))`**

- *fd* : mapping location (*r*, *θ*, *z*), which is expressed in cylinder coordinates, to (*r'*, *θ'*, *z'*).
- *fc* : mapping cross section *c* at location (*r*, *θ*, *z*) to *c'* at (*r'*, *θ'*, *z'*).
- *fv* : mapping printing speed *v* at location (*r*, *θ*, *z*) to *v'* at (*r'*, *θ'*, *z'*).

## ► Deformations must preserve “printability”.

# Deformation: Examples

## ► Plate:

```
deform_cylinder(  
  fdd( $r, \theta, z$ ), fcd( $c, r, \theta, z$ ), fvd( $v, r, \theta, z$ )  
  where  $fdd(r, \theta, z) = (r + 1.05 z, \theta, 0.3 z)$ .
```

Displayed by  
Repetier-Host

## ► Vase:

```
deform_cylinder(  
  fdp( $r, \theta, z$ ), fcp( $c, r, \theta, z$ ), fvp( $v, r, \theta, z$ )  
  where  $fdp(r, \theta, z) =$   
  ( $r(0.8 + 0.4 \sin(z / 8 + 6.5)), \theta, z$ )
```

# Deformation: Examples (cont'd)

## ► Sphere:

`deform_cylinder(fds(r,  $\theta$ , z), fvs(v, r,  $\theta$ , z), fcs(c, r,  $\theta$ , z))`

where  $fds(r, \theta, z) =$

$(Radius * \sin(z / cylinderHeight), \theta, r - Radius * \cos(z / cylinderHeight))$

Another  
deformation

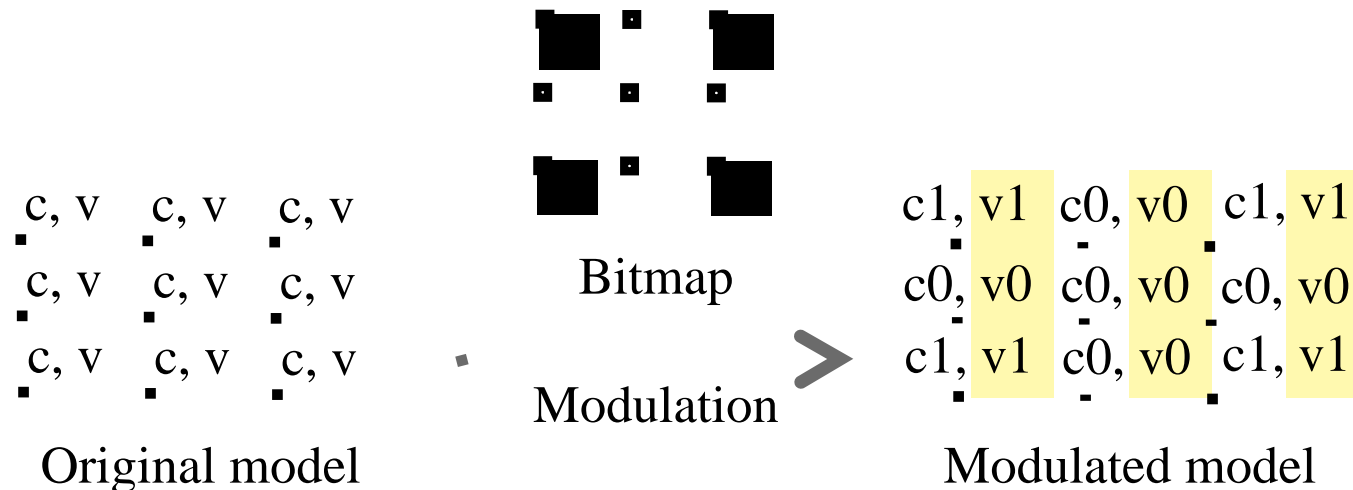

# Additional Technique: Texture Mapping

- ▶ A method for mapping textures, characters, or pictures on the surface of printed objects is proposed.

- Textures are expressed by difference of cross-sections of filaments.

- ▶ Cross-sections of filament fragments are modulated by a bitmap.
